Detection of other vehicles around

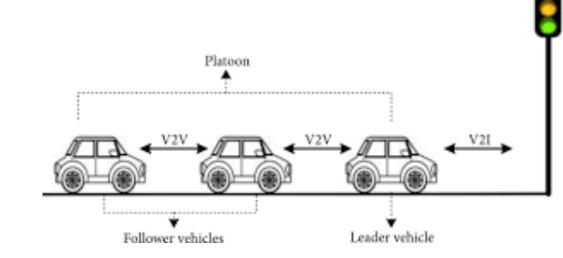

- Create a network to share information about object detection
- CPMs https://www.vanetza.org
- APUs or Jetsons (Camera detection)

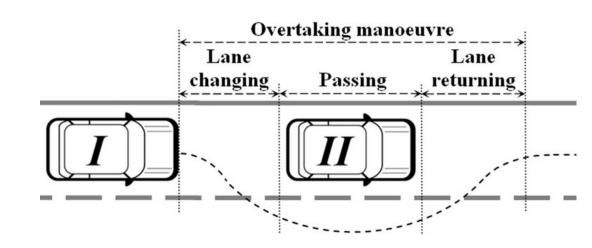

Autonomous Vehicle Platooning

- Create a network to share information between vehicles
- Real-time simulation in map
- APUs

Collaborative Overtaking

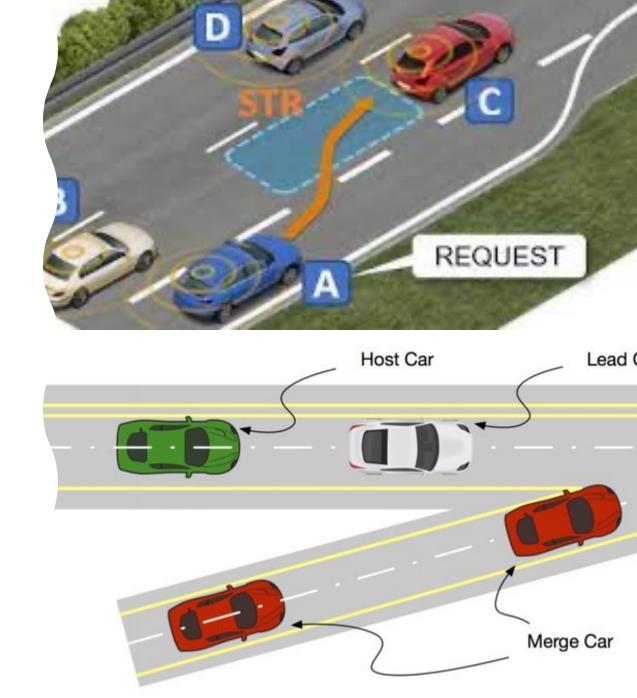

- Guiding through the receiving messages
- With visibility or no visibility
- APUs

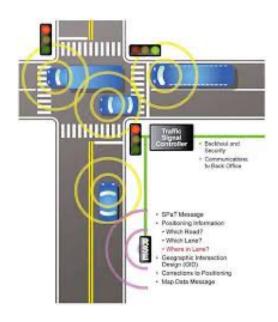

Lane merge

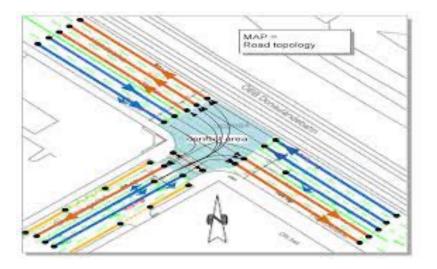

- Guiding through the receiving messages
- Control between the various vehicles to allow a car to enter the main road
- APUs

Traffic signal control with messaging between vehicles and infrastructure

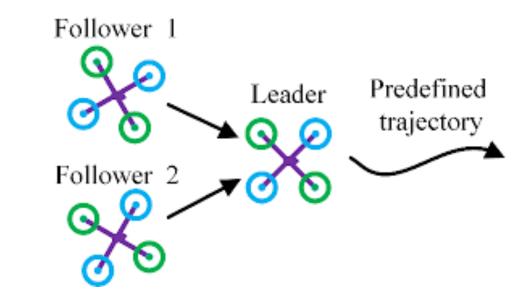

- Messaging between traffic lights
- Messaging between traffic lights and vehicles
- 3. Messaging between traffic lights, vehicles and pedestrians

Drones Formation Control

- Collaborative position information network
- Movement intention, speed, etc.
- Formation control
- Map representation with real-time simulation
- APUs

Cooperative object detection

- Object detection and share with other UAVs
- Avoidance of specific areas

Relay Race

- Most drones are limited in how far they can fly
- Drones to pass off current position to each other mid-flight
- Next drone continues path

THE NEXT THING IN DRONE DELIVERY: IBM PATENTS A RELAY RACE OF DRONES

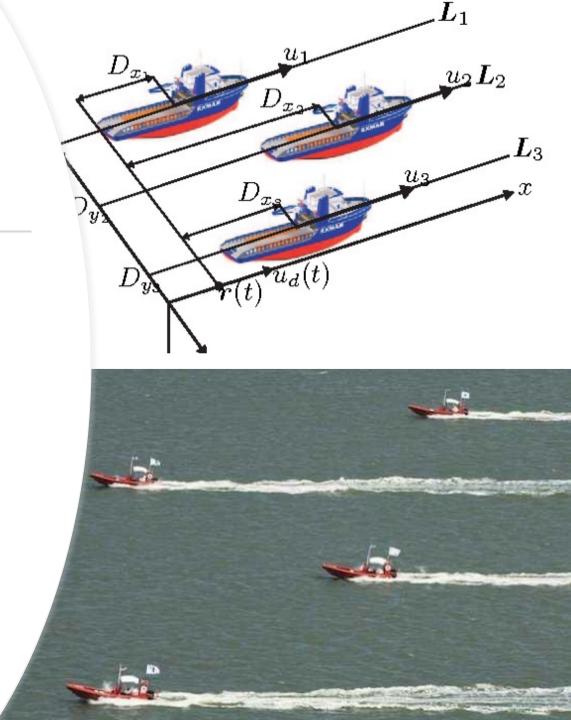

Boat race with data gathering

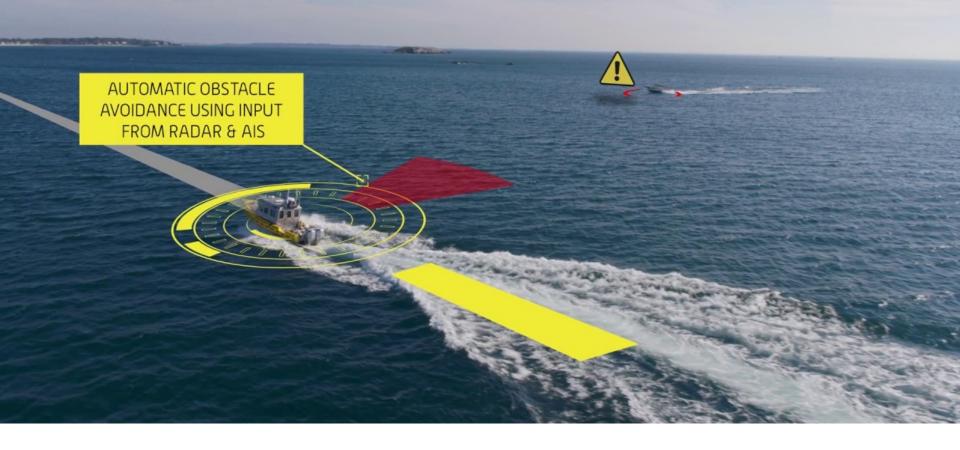

- Only after gathering all the required data, it passes information to the next boat
- Sends coordinates of the next target to the following boat in the mission/race

Automated boats formation

- Collaborative position information network
- Movement intention, speed, etc.
- Formation control

Cooperative obstacle avoidance

- Object detection and share with other automated boats
- Avoidance of specific areas
